

Growth Regulators

Featuring

B-NINE WSG (daminozide)

B-Nine is the original safe and reliable plant growth regulator for use on Chrysanthemums, Azaleas, Bedding Plants, Poinsettias and Hydrangeas. It contains 85% Daminozide. Stems are stronger and leaves are greener and more drought resistant. Plants grow out of the effects relatively quickly. The water soluble granule formulation is easy to handle and less dusty.

BONZI (paclobutrazol)

Bonzi produces plants with shorter internodes, more branching, improved root development and deeper colour. It is taken up quickly by stems and roots with complete absorption occurring within minutes of application. The effects are long lasting in the plants

A-REST (ancymidol)

A-Rest reduces internode elongation for desirable plant size, while producing no phytotoxic effects.

CYCOCEL EXTRA (chlormequat chloride)

Cycocel Extra is a safe treatment for height control in Poinsettias and Geraniums.

allowing for fewer applications. Registered crops include numerous bedding plants in plug trays, cell packs and pots.

SUMAGIC (uniconazole-P)

Sumagic is an extremely active chemical plant growth regulator with some unique advantages: It has a broad range of crops that it is active on and labeled for, it has flexible application methods and is long-lasting in the plant.

Experience has shown that Sumagic works better on certain crops than other PGR's. Low rates, fewer applications, greater height control add up to a very efficient tool for growth management in greenhouse plants.

FASCINATION

(benzyladenine and gibberellins)

Fascination decreases yellowing and necrosis of lower leaves and delays flower senescence in Lilies.

STIM ROOT ROOTING POWDER

Stim Root #1

0.1% IBA is ideal for softwood cuttings and easy to propagate plants.

Available in 100g, 500g and 10 kg sizes.

Stim Root #2

0.4% IBA is ideal for semi-hardwood plants, for rooting woody and semi woody plants and easy to propagate evergreens.

Available in 100g, 500g and 10kg sizes.

Stim Root #3

0.8% IBA is ideal for hardwood plants and for rooting difficult to propagate plants such as evergreens and dormant leafless cuttings.

Available in 100g, 500g and 10kg sizes.

STIM ROOT LIQUID

Liquid Stim Root's effectiveness comes from higher concentrations of IBA, more uniform application to cuttings, and better penetration into woody cuttings. Better rooting than with powders, occurs with many hard-to-root species. The carrier used has greater potential to burn than the powder, so a trial on a small number of cuttings at different concentrations is always recommended.

Stim Root is available in 1L and 20L sizes and in concentrations 2500ppm, 5000ppm and 10000ppm.
